

ABSTRACT

Embodiments provide a system, method, apparatus, means, and computer program code for identifying a speaker participating in a conference.

During the conference or collaboration event, users may participate in the
5 conference via user or client devices (e.g., computers) that are connected to or
in communication with a server or collaboration system. A person participating
in and/or moderating a conference may want to know which of the other
participants is speaking at any give time, both for those participants that have a
unique channel to the conference (e.g., a single participant participating in the
10 conference via a single telephone or other connection) as well as participants
that are aggregated behind a single channel to the conference (e.g., three
participants in a conference room with a single telephone line or other
connection to the conference).
